

# SuperStore Sales & Profitability — Executive Summary

Subhranshu Panda | Data Analysis Project | Order data 2015-01-03 to 2018-12-30

| Total Sales | Total Profit | Margin | Orders | Customers | Repeat Rate |
|-------------|--------------|--------|--------|-----------|-------------|
| \$2,261,537 | \$278,979    | 12.3%  | 4,922  | 793       | 98.4%       |

## Key Findings

- **Furniture is a volume trap:** #2 category by revenue but weakest on profit — Tables (-9.0% margin) and Bookcases (-3.0% margin) are loss-making.
- **Discounts beyond ~20% erase profit:** average profit per order turns negative past the 0.2 discount band; 30–50% discounts lose ~\$157/order on average.
- **Regional blind spots:** Texas, Ohio, Pennsylvania and Illinois are top-10 states by sales yet net-negative on profit.
- **Growth rebounded:** sales fell 4.3% in 2016, then grew 30.6% (2017) and 20.3% (2018).
- **Retention is strong:** 98% of customers reorder — the growth lever is margin per order, not acquisition.

## Profit by Sub-Category & Discount Impact

## Recommendations

- Cap discounts on Furniture (Tables, Bookcases) at ≤20% to stop subsidising loss-making orders.
- Review regional pricing/cost-to-serve in TX, OH, PA and IL — the issue is margin, not demand.
- Run a win-back campaign targeting the ~200 'At Risk'/'Lost' RFM customer segments.
- Plan inventory and staffing for the consistent Q4 seasonal peak.

Full analysis: Jupyter notebook + interactive Streamlit dashboard in the project repository. Profit/Discount/Quantity fields were merged in from a public reference dataset on a verified Row ID join — see data/README.md.
